Académie canadienne d'audiologie  
Entendus. Compris. **ACA**

# CAA Webinars Now Include Live Zoom Transcription

Locate the 'Live Transcript' icon on the bottom of your Zoom screen. (You may need to place your cursor at the bottom of the PPT for this to appear.) You can also select a larger font for your Transcript by selecting 'Subtitle Settings'.

Select the 'Q@A' icon if you have questions or require technical assistance

You have joined using Computer Audio' - if you wish to change to Phone, select the arrow besides 'Audio Settings', and then switch to 'Phone Call'. The dial in number will be displayed

# Enlarge the Presenters Video

To enlarge the Presenters video – place your cursor to the left of the video(s) and drag to expand.

**CAA webinars count towards CEUs.**

This webinar is being recorded and will be posted to the CAA website within 2 business days (including PPT).

[canadianaudiology.ca/webinars/](http://canadianaudiology.ca/webinars/)

# Thanks to our Sponsor

Canadian Academy of Audiology is a professional association dedicated to enhancing the role of audiologists as primary hearing health care providers through advocacy, education and research.

# Moderator – Steve Aiken

Dr. Steve Aiken is an Associate Professor of Audiology, Surgery, Psychology and Neuroscience at Dalhousie University. He holds a master's degree in Audiology from the University of Western Ontario and a PhD in Medical Science from the University of Toronto.

# Agenda

11:00 Welcome and Introduction

11:05 Steve Aiken gives overview of the VCM and introduces speakers in turn:

- Filip Roenne, WSaudiology
- Thomas Behrens - Oticon
- Jill Mecklenburger - ReSound
- Sara Burdak - Starkey
- Gurjit Singh - Sonova

12:00 Steve Aiken – Questions from the audience

12:15 Steve Aiken presents the Richard Seewald Award to JP Gagne

12:20 Panel Discussion moderated by Steve Aiken

12:45 Questions from the audience

1:00 End

# Moderator – Steve Aiken

## The Future of Hearing Aid Technology

This session will include individual talks followed by a roundtable discussion.

### Learning Objectives:

- List at least three advancements coming to hearing aid technology
- Describe how sensors can be used to adapt to listener needs
- Describe processes that inform decision making about hearing aids

# **Industry Speaker Presentations:**

# From Real-Life Hearing to Real-Life Participation

Filip Marchman Rønne, Global head of Scientific Audiology, WS Audiology

# Future hearing aid technology

Filip Marchman Rønne  
Global Head of Scientific Audiology

WSAudiology

From listening

It is important that you can hear everything in your important life situations.

To participating

It is important you can participate in your important life situations.

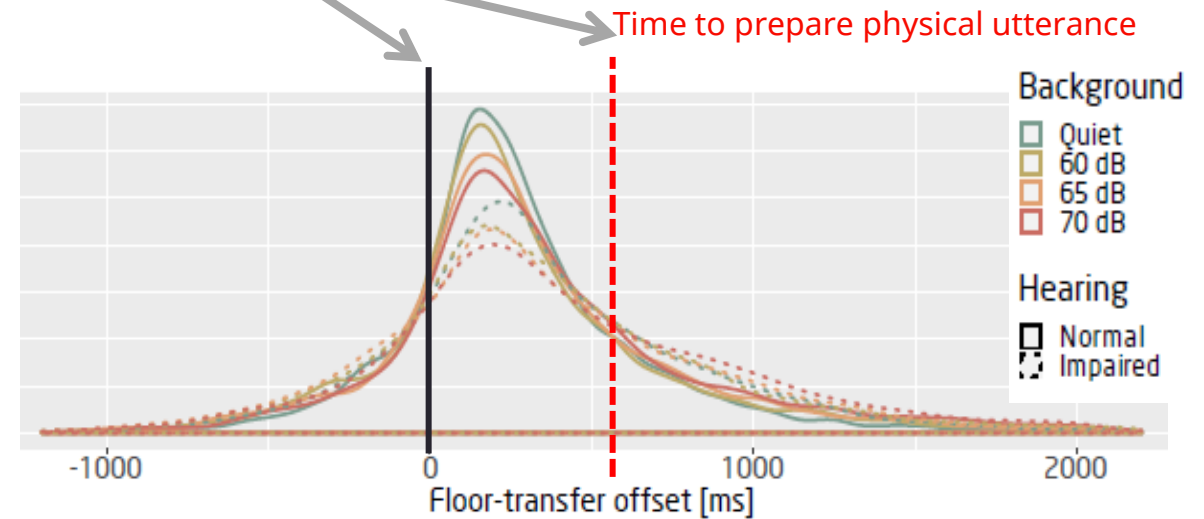

# Focused listening or speech communication?

Conversations in noisy environments remains a key challenge for hearing aid users. However, most tests only cares about the focused listening part of a conversation, and thus hearing aids are developed and optimized for listening. We want to enable people to participate not just listen.

# What are the dynamics of a conversation?

How do we measure, how do we optimize?

Sørensen et al, 2019, ISAAR poster

# Conversational Dynamics: How could we measure it?

Borch Petersen et al, submitted

## Task performance [pair]:

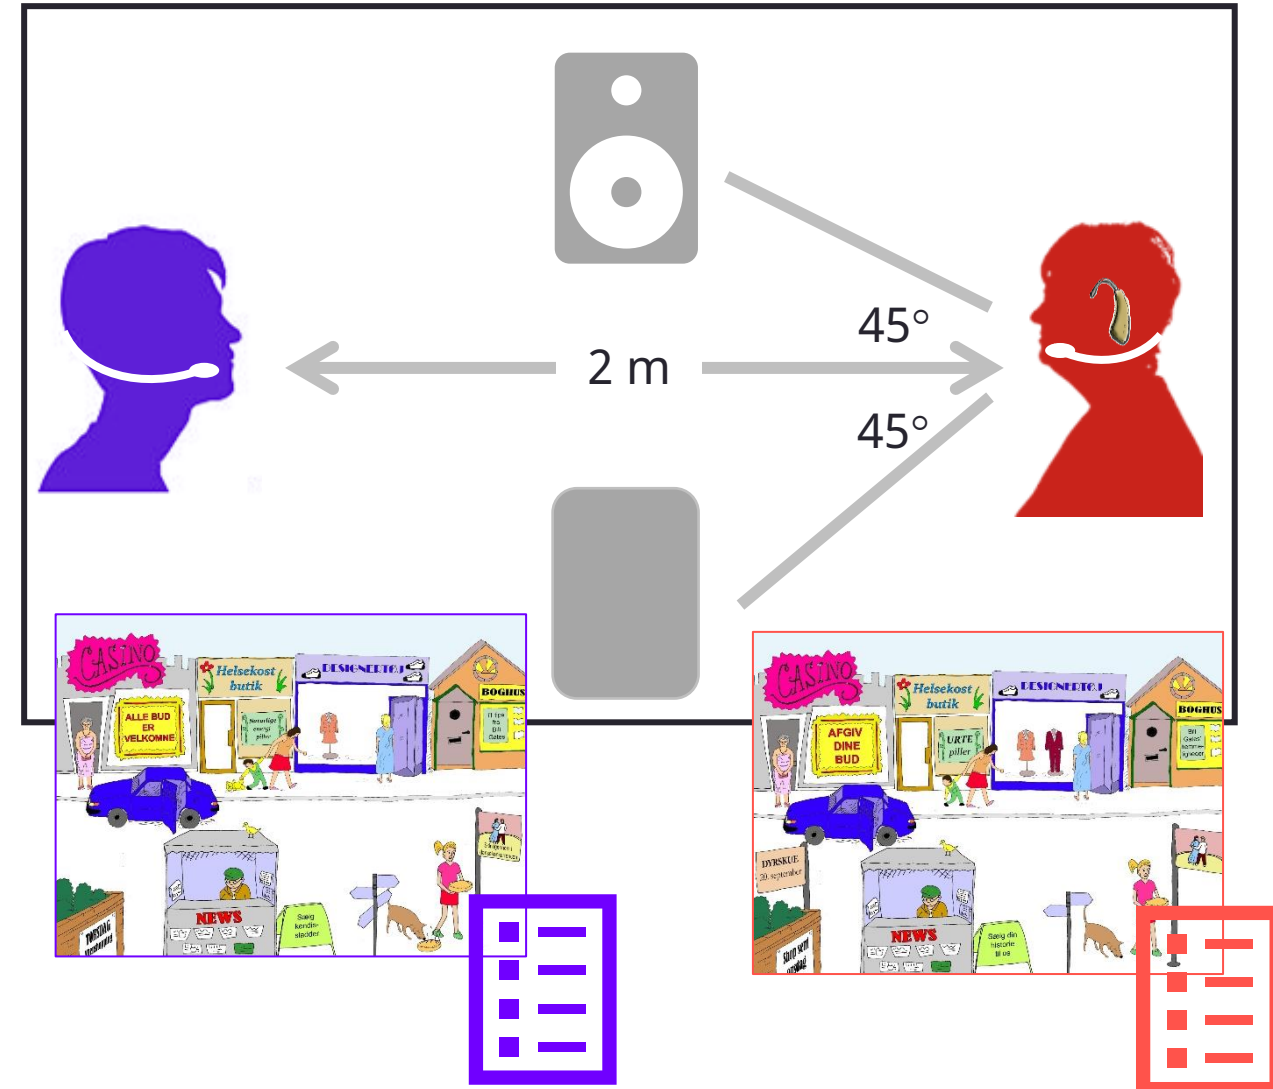

- Completion time [corrected]
- Speaking time between

## Subjective ratings [individual]:

- How successful was the conversation
- How likely would you be to remove yourself from the situation if it occurred in your everyday life
- What was your talking effort
- What was your listening effort

## Conversational dynamics [individual]:

- Floor Transfer Offset → How timed
- Speech level → How loud
- Articulation rate → How fast
- Median utterance duration → For how long

# Conversational Dynamics: Early findings

Borch Petersen et al, submitted

## Effects of Noise:

→ Noise reduces the conversation efficiency

## Effects of Hearing Loss:

→ Person with hearing loss struggle to time their communication

## Effects for Normal Hearing:

→ person with normal hearing adapt their communication

## Effects of Wearing a Hearing-Aid:

→ Amplification makes the person with a hearing loss 'more normal' – at least in quiet

# People have different needs and preferences.

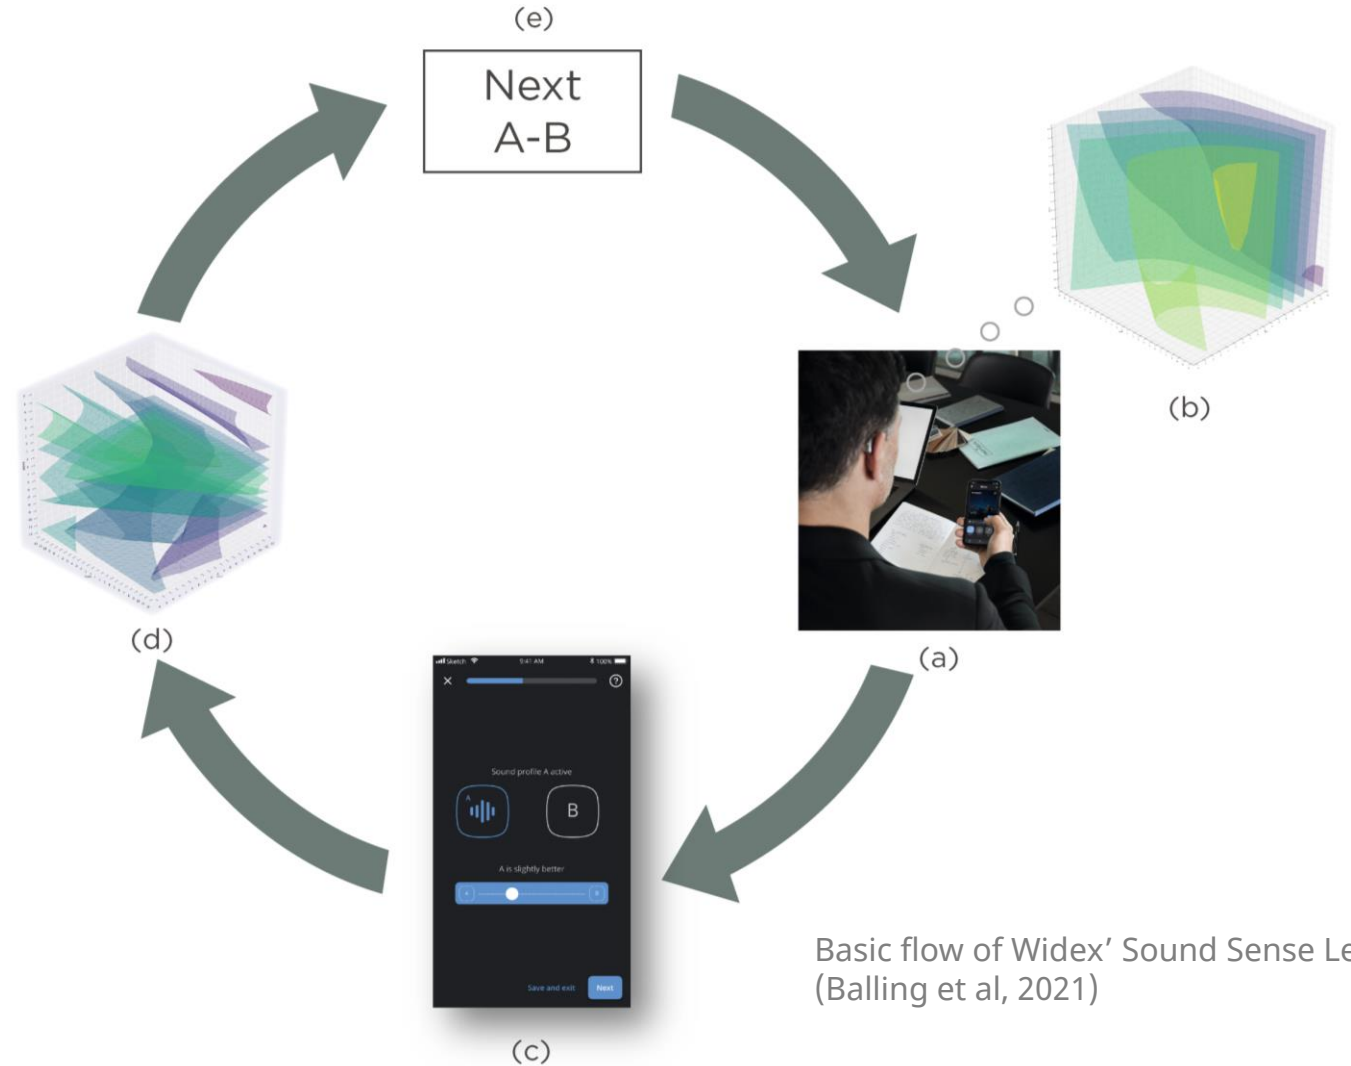

A solution: "Sound Sense Learn"

To cater for individual needs and preferences, user input and machine learning can be combined to optimize the sound.

People have widely different preferences. There is not a one-fits-all solution.

Sample of 20,000 SSL programs (Balling et al, 2021)

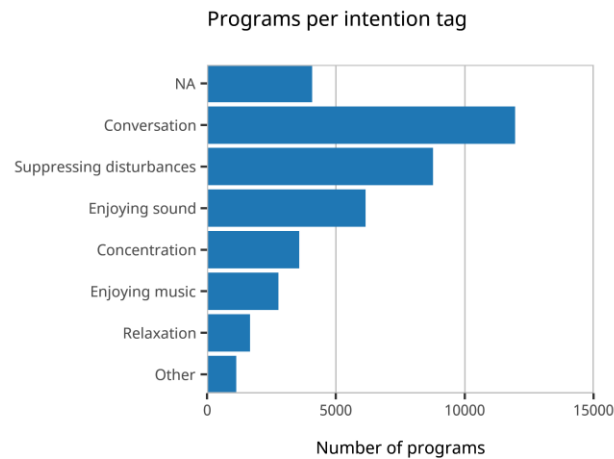

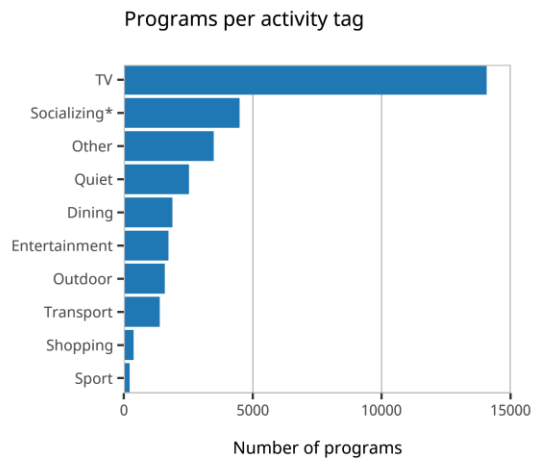

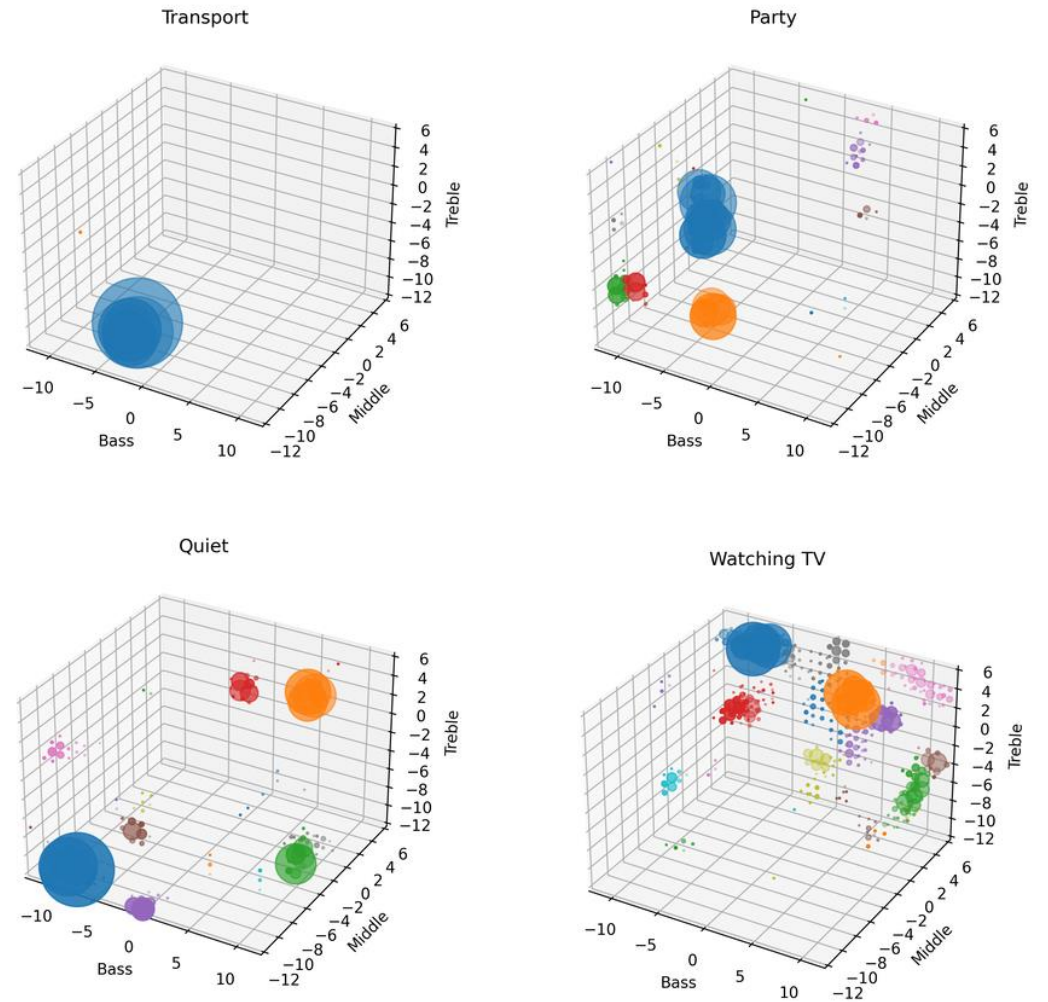

Basic flow of Widex' Sound Sense Learn (Balling et al, 2021)

# Sound Sense Learn, and excellent solution to optimize listening

If created programs are sorted according to their “activity” or “intention” tag, clusters appears.

Are we lacking some of the most critical moments?

Clusters of programs within activity tag (Balling et al, 2021)

# Can we extract people's intent without asking?

Possible solution: Auricular EMG

*Speech in speech remains the key challenge for people with hearing loss, and for hearing aid users.*

Speech separation

Source selection

Source presentation

*This is you!*

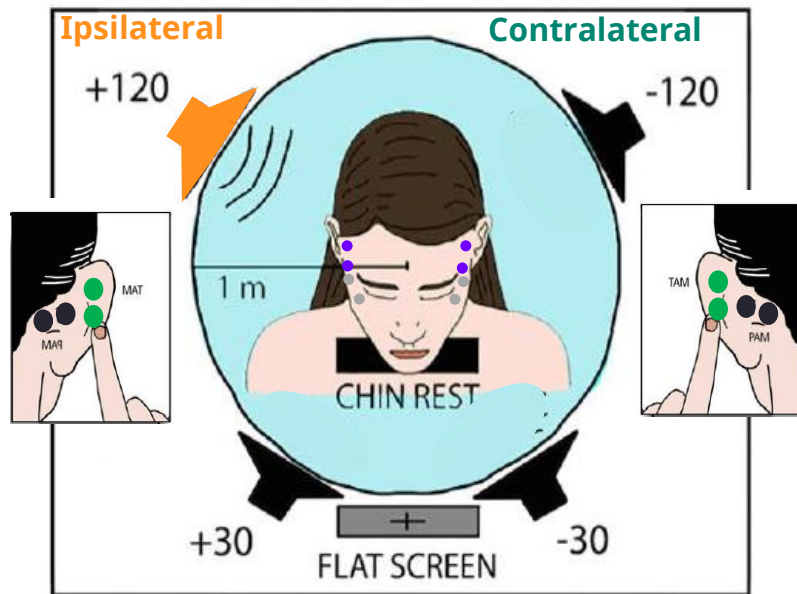

*But are you listening to **Green** or **Grey**?*

*And what should the HA do?*

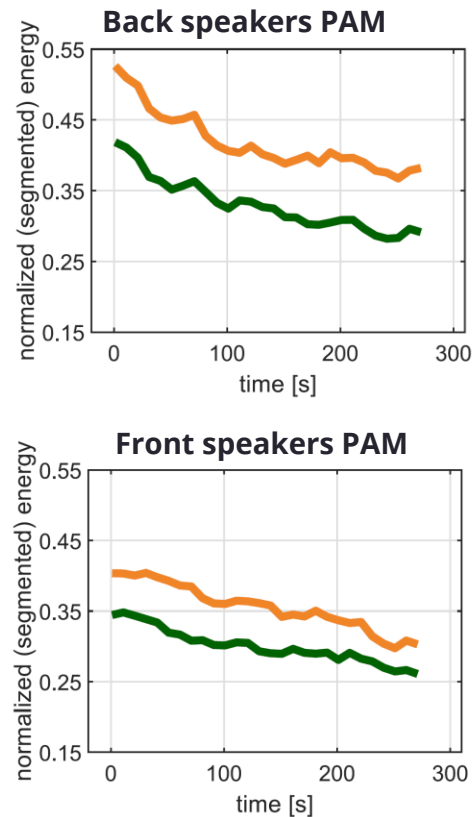

# Estimating the direction of attention using auricular EMG

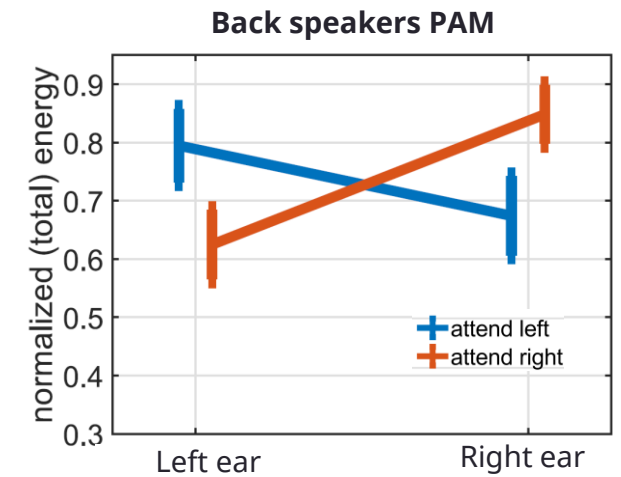

Task: Attend to one of two simultaneous audiobooks

Attention direction affects the EMG

Responses between ears indicates the direction of attention

# Potential use cases for EMG controlled hearing-aids

By utilizing recorded EMG responses, use-intent can control the directionality of the hearing aid

## Use case 1: Triggered attention

**You** are talking to **green**, but suddenly **grey** catches your attention

Do **you** prefer to stay focused on **grey** or return to **green**?

*You should ask **Purple**,  
she ....*

## Use case 2: Asserted attention

**Two conversations** are ongoing.

Do **You** turn your attention to either one, or none of them?

From listening

It is important that you can hear everything in your important life situations.

To participating

It is important you can participate in your important life situations.

# BrainHearing Technologies Expanding the Reach of the Clinic and the Patient Benefits

Part 1 – Technical evidence

WHITEPAPER 2021

**Oticon More™ competitive benchmark Part 2**  
– Clinical evidence

WHITEPAPER 2021

**Oticon More™ clinical evidence**

WHITEPAPER 2020

**ABSTRACT**  
This whitepaper presents the results of four research studies carried out with Oticon More™, providing clinical evidence for BrainHearing™ benefits of More for the ability of the brain to orient, focus, and recognize.  
Using a novel analysis method of brain responses measured via electroencephalography (EEG), we show that the PureSound Intelligence™ (PSI) feature in More leads to a clearer representation of the full sound scene in the brain, as well as clearer sounds in the foreground and better focus on the sounds of interest, surpassing what is achieved with Oticon Opn S.  
Such improvements translate into a better ability to understand the talker in focus in multi-talker situations in both simple and complex environments when using More. Measures of speech understanding in noise and memory recall also show significantly improved speech recognition and long term memory recall with More compared to Opn S, demonstrating further benefits of More for cognition, with more successful and less effortful listening.

WHITEPAPER 2021

**The development behind Oticon MyMusic™**

TECH PAPER 2021

**Oticon MyMusic™ – Clinical Evidence**

WHITEPAPER 2021

**SUMMARY**  
Oticon is introducing the MyMusic™ dedicated music program in Oticon More. MyMusic is the result of developing a music rationale in its own right, based on current evidence on music perception in people with hearing loss and hearing aids and recommendations for optimal music amplification and listening.  
In this white paper, we share with you the clinical study performed with 23 test participants who compared Oticon MyMusic to the previous music program and the General program in Oticon More. The participants represented a wide range of hearing impairments and both aid and casual music listeners were represented. Prior to the study, a total of 8 music and speech sound scenes were recorded in order to include different types and styles of music, as well as different listening modalities (live music sound scenes, stereo/living room sound scenes, and streaming sound scenes). Each participant stated their preference to a blind and randomized setup where they listened to the sound recordings using headphones. The method used was a modified sound preference test similar to Han et al. (2011). Results showed a significant preference for Oticon MyMusic over both the previous music program and the General program, for all music sound scenes. In fact, Oticon MyMusic was rated 72% higher than the previous music program, on average.  
This result is a testament to the new game-changing music rationale in Oticon More hearing aids that improves the music listening experience for people with hearing loss.

Jill Mecklenburger, Principal Audiologist, ReSound

# Patient Benefits of Microphone and Receiver In the Ear (M&RIE) Technology

Jill Mecklenburger, Au.D  
ReSound Global Audiology

# Receiver In The Ear

## Advantages

- Comfortable and cosmetically appealing
- Ability to provide a wide range of features
- Robust wireless connectivity
- Convenient for audiologists to stock
- Instantly fit with domes, selectable power level of receiver

## Drawbacks

- Microphone location above or behind pinna
- Unnatural sound quality for some individuals

# Spatial Hearing: Externalization of Sounds

No Spatialization

True Spatialization

# Pinna Compensation and Restoration Algorithms

- Created to compensate for potential negative effects of microphone location on localization and sound quality
- Utilize the hearing aid microphones to replicate the spatial directivity patterns of an average ear
- Improvement seen for front-back localization
- However, these algorithms work best for sounds from the front on the horizontal plane – unlike the human ear
  - ILD errors of up to 30 dB depending on the location at the pinna (Udesen et al, 2013)

# M&RIE

Our individual ear provides

- Our own unique acoustics
- Localization
- Spatialization

# Organic hearing as a baseline for the design of a new receiver-type

**M&RIE**  
Microphone & Receiver-In-Ear

# M&RIE Benefits

- Better SNR
- Better estimation of direction of arrival of sound
- Better depth and distance perception
- Synergy between the visual and auditory systems

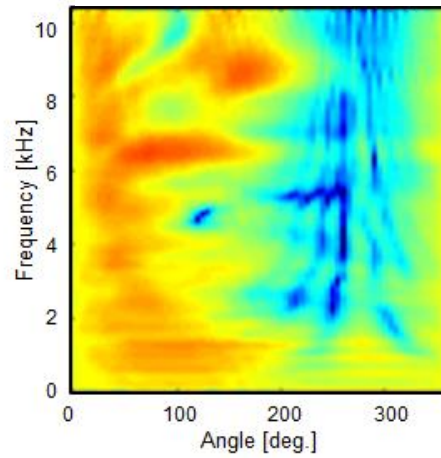

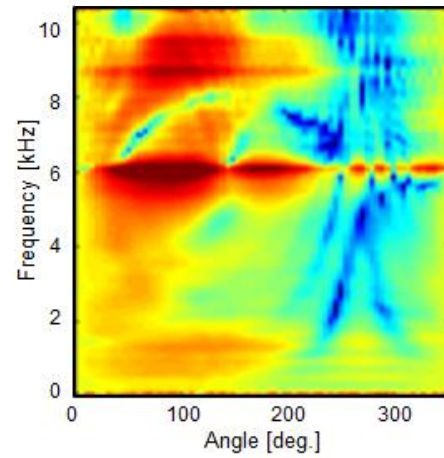

Open Ear

Pinna Restoration [PR]

# Localization

## Average localization error

Localization

Localization benefit over time

# Wind Noise Reduction

## Wind noise

Difference in average wind noise:  
M&RIE vs omnidirectional setting (dB)

Light Breeze: 2 m/s

**19 dB**

Gentle Breeze: 5 m/s

**15 dB**

Fresh Breeze: 8 m/s

**14 dB**

# Listening Effort

# Listening Effort

- 2.6 dB overall listening effort benefit with M&RIE
- Only 1.8 dB benefit with traditional mic placement

- Speech recognition better with M&RIE than with traditional mic placement

# User benefits of M&RIE?

Reduced wind noise

Less listening effort

Localization

Sound quality

M&RIE

curve

Target gain  
curves  
calculated  
based on the  
HL

## Key Takeaways

- Proof of benefit study results show a sound quality preference for M&RIE over Omnidirectional and a Pinna Restoration algorithm
- M&RIE preserves valuable information that aids in localization
- Wind noise reduction improvements are significant with the placement of a microphone in the ear
- M&RIE combines the advantages of the RIE style with the benefits of personalization by collecting sound in the ear canals of the user

# Integrated People-Centred Care Systems

World Health Organization, WHO global strategy on integrated people-centred health services 2016-2026

## Integrated People-Centred Care:

- Care approaches and practices that see the **person as a whole** with many levels of needs and goals, with these needs coming from their own personal social determinants of health.
- Adopts and responds to the perspectives of **individuals', carers', families' and communities'** perspectives as participants in their care.
- It is organized around the health **needs and expectations of people** rather than diseases.
- The management and delivery of health services such that people receive a continuum of **health promotion, disease prevention, diagnosis, treatment, disease-management, rehabilitation** and palliative care services, through the different levels and sites of care within the health system, and according to their needs throughout the life course.
